

Note: Before connecting the booster, follow directions on next page!!!!

Important!!!
You must adjust the small blue potentiometer using a screw driver to set the output voltage to 18-24 v DC before using the DC to DC booster.

Measure voltage first, before adding to circuit. Have 12vdc to IN+ and IN- and measure OUT+ and OUT- for 18 to 24vdc (no higher) by adjusting the blue potentiometer.
